In an emergency situation or on short notice, a user should have the appropriate supplies to initiate limited epidemiological activities in a field setting or in an emergency Department of Public Health (DPH) location.

**Administrative**
- Located in front pocket of the black backpack; paperwork is in the expandable file and binder
- Designed to have all necessary paperwork to support user in field for short duration, such as lab slips, material for collection and labeling of lab specimens, reference material
- Also contains items such as flashlight and duct tape

**Core**
- Contains all personal protective equipment
- Provides protection for up to 5 persons for a limited duration from disease transmission: standard, contact, droplet, airborne

**Enteric**
- Designed to support enteric specimen collection on 5-10 patients. Must check routinely for expiration of stool C&S/O&P medium.

Two types of kits were assembled: Go-Kits and Epi Go-Kits. Both kits are modular, and supplies can be chosen based on the type of outbreak. Each kit was designed to support a team of up to five users. A fanny pack was also assembled to accompany the kits.

The Go-Kits contain supplies associated with investigation activities: case investigation, contact tracing, and laboratory testing activities. The Go-Kit supplies include, but are not limited to, the following: administrative supplies, personal protective equipment, and a laptop. The Epi Go-Kits are carried in a rolling expanded briefcase. The laptop has statistical and database software, like SAS, Epi-Info, and Microsoft Access, loaded on it. Desired reference materials will also be preloaded onto the computers. In the future, a portable printer will be available.

The Fanny Pack includes basic supplies, such as pens, pencils, alcohol swabs, gloves, and hand sanitizer.

**Module Descriptions**

**Epidemiology and Disease Control Go-Kits**
