COVID-19 and tuberculosis (TB): Be alert for these overlapping syndromes!

Consider TB disease as a cause of respiratory illness – even in those who test positive for COVID-19 – when TB risks, signs, symptoms or imaging findings below are present.

Risks for TB disease:
- Lived outside the United States
- Immunocompromised
- Close contact to someone with TB disease

Signs and symptoms more consistent with TB disease:
- Persistent cough ≥3 weeks
- Weight loss
- Hemothysis

Imaging findings of TB disease: The appearance of active TB is highly variable, and certain imaging findings overlap with those often present in COVID-19. Below are six chest x-rays of patients with TB disease:

Findings of TB disease (clockwise from top left): cavitary consolidation, pleural effusion, consolidation and bronchiectasis, miliary nodules, lymphadenopathy (widened right paratracheal stripe), apical scarring and cavities.

Call to report suspected or confirmed TB: (628) 206-3398
